- 1) Since May 2001 the Danish abattoirs have monitored the presence of antibiotic residues as a part of the own check programme.
- 2) The number represents samples from slaughterpigs and sows/boars in total, of which four sows in 2012 and 2 sample in 2013 were revealed with antibiotics above the MRL

1) Blood samples collected from both slaughterpigs and sows/boars

Samples are all analysed for: Sulphadiazine, Sulphamerazine, Sulphadoxine, Sulphatroxazole, Sulphamethazine, Sulphamethoxazole, Sulphadosine, Sulphathiazole and Sulphamethizole.

2) Kidney samples analysed with LC – MS/MS

*) The amount of residues does not exceed a level harmful to the consumer

Re. Dioxin: In 2000 - 2003 yearly 5 samples of pig fat have been randomly analysed for the presence of Dioxin. In 2003 – 2008 yearly 10 samples of pig fat have been randomly analysed for the presence of Dioxin. From 2009 the number of samples have been increased to around 100 samples yearly. The monitoring to date has shown no cases where levels have exceeded permitted maximum residue limits (MRLs)
